# Hacking Home Wiring

How to hack your home phone wiring for  
DSL

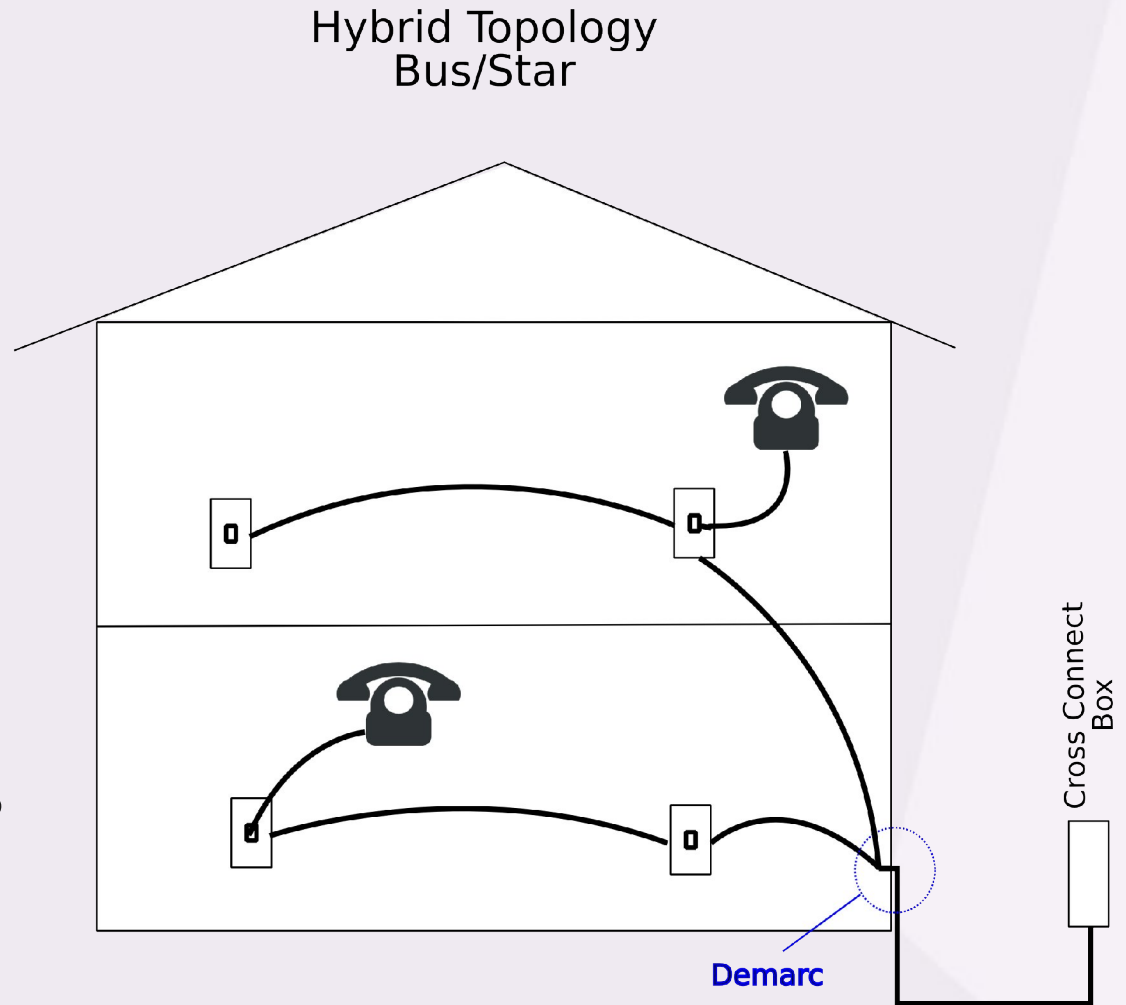

# Bus Topology

- Very common
- All wall jacks are daisy-chained
- Often the least cabling required
- One pair of “inside” wires on your demarc

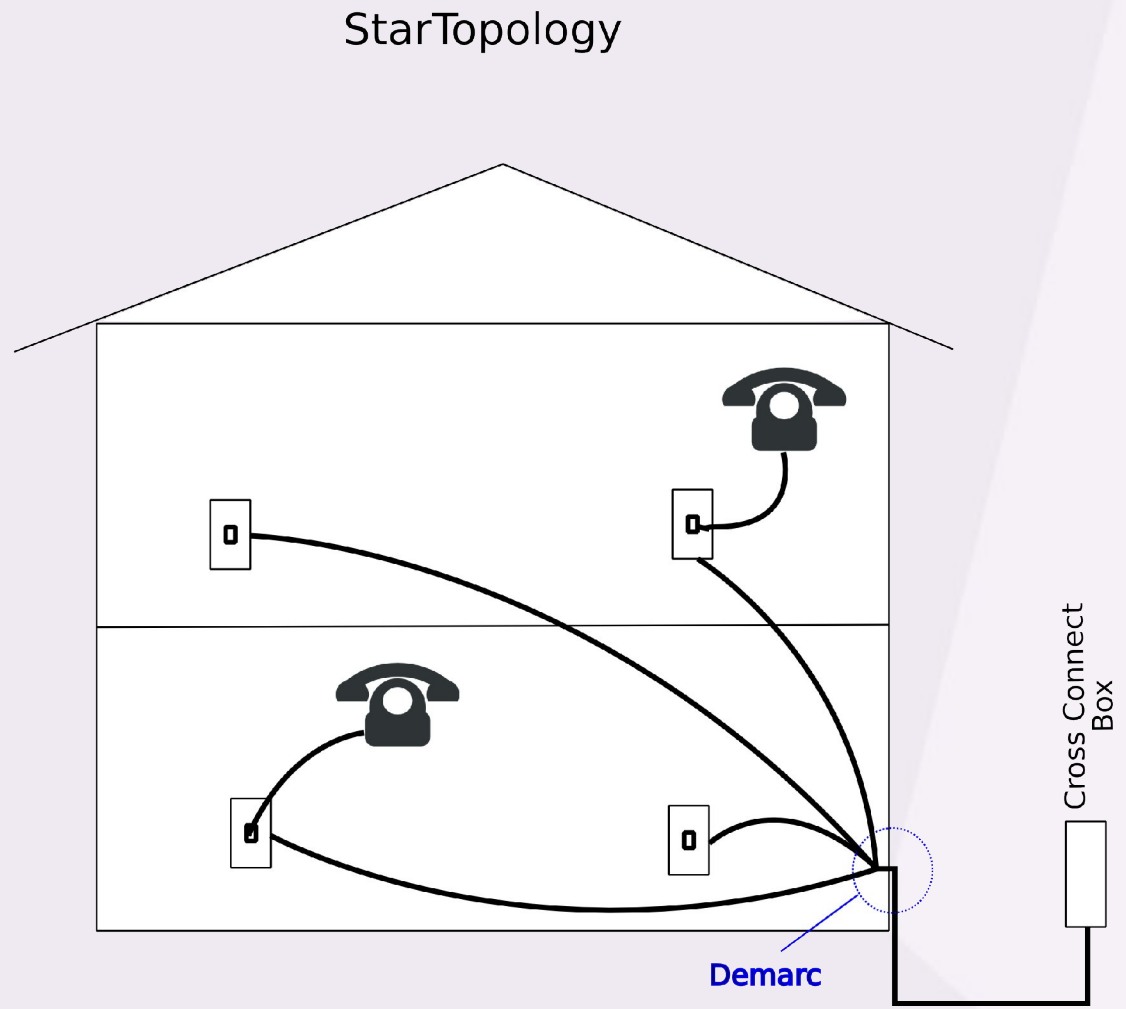

# Hybrid Topology

- Also common
- Two or more busses lead from demarcation point
- Probably done to minimize cabling in larger homes
- Multiple internal pairs of wires on your demarc

# Star Topology

- Least common
- Each wall jack is wired separately
- This is ideal, but uses more copper and more cross-connect hardware
- One pair of internal wires on the demarc for each wall jack

# Which do you have?

- Count the wall jacks
- Count the pairs of wires on your demarc.
- Get a mental picture of how the wires actually lay out
- Disconnect a pair and see what phones it affects
- Use a tone generator/inductive amp to find where wires go
- Label them.

# Very Old Bell Demarc

- Circa 1970s or older
- Bolted to a floor joist or plywood panel inside the house or the garage
- Can be two terminal, four or more
- Built in lightning protection, be careful

# Old 66 block

- Circa 1980s
- May not be a demarc, used for distribution and just as handy
- Rows are all connected
- Use a 66 punch tool, but can be done by hand

# Outside demarc

- Circa 1990s and forward
- Has small area that you can access.
- It's best to find an inside point to work with.

# Telephone Wiring Basics

- Often two pairs of wires: red/green and yellow/black
- Could be CAT3 or CAT 5 which is four pairs: blue, orange, green, and brown.
- Solid copper

# Wire colour code

- Tip and Ring refer to the plug connectors
- Standard wire colour codes based on type of wire
- Wire consistently

Wire Type	Tip (ground)	Ring (-48v)
Phone cable	Green	Red
	Black	Yellow
CAT 3, 5, or 6	White w/stripes	Blue, Orange, Green, Brown
Old phone cable	White	Blue
	Red	Orange

# Installing a Common DSL Filter

- Step 1: See what you are working with
  - Locate your demarc, or the distribution block
  - Identify the outside pair(s) of wires, they may be labeled CO
  - Identify the inside pairs
  - Do you have one incoming phone line or two?
  - If so which has DSL?
  - Take photos, and/or write things down in case you need to back out

# How to centralize

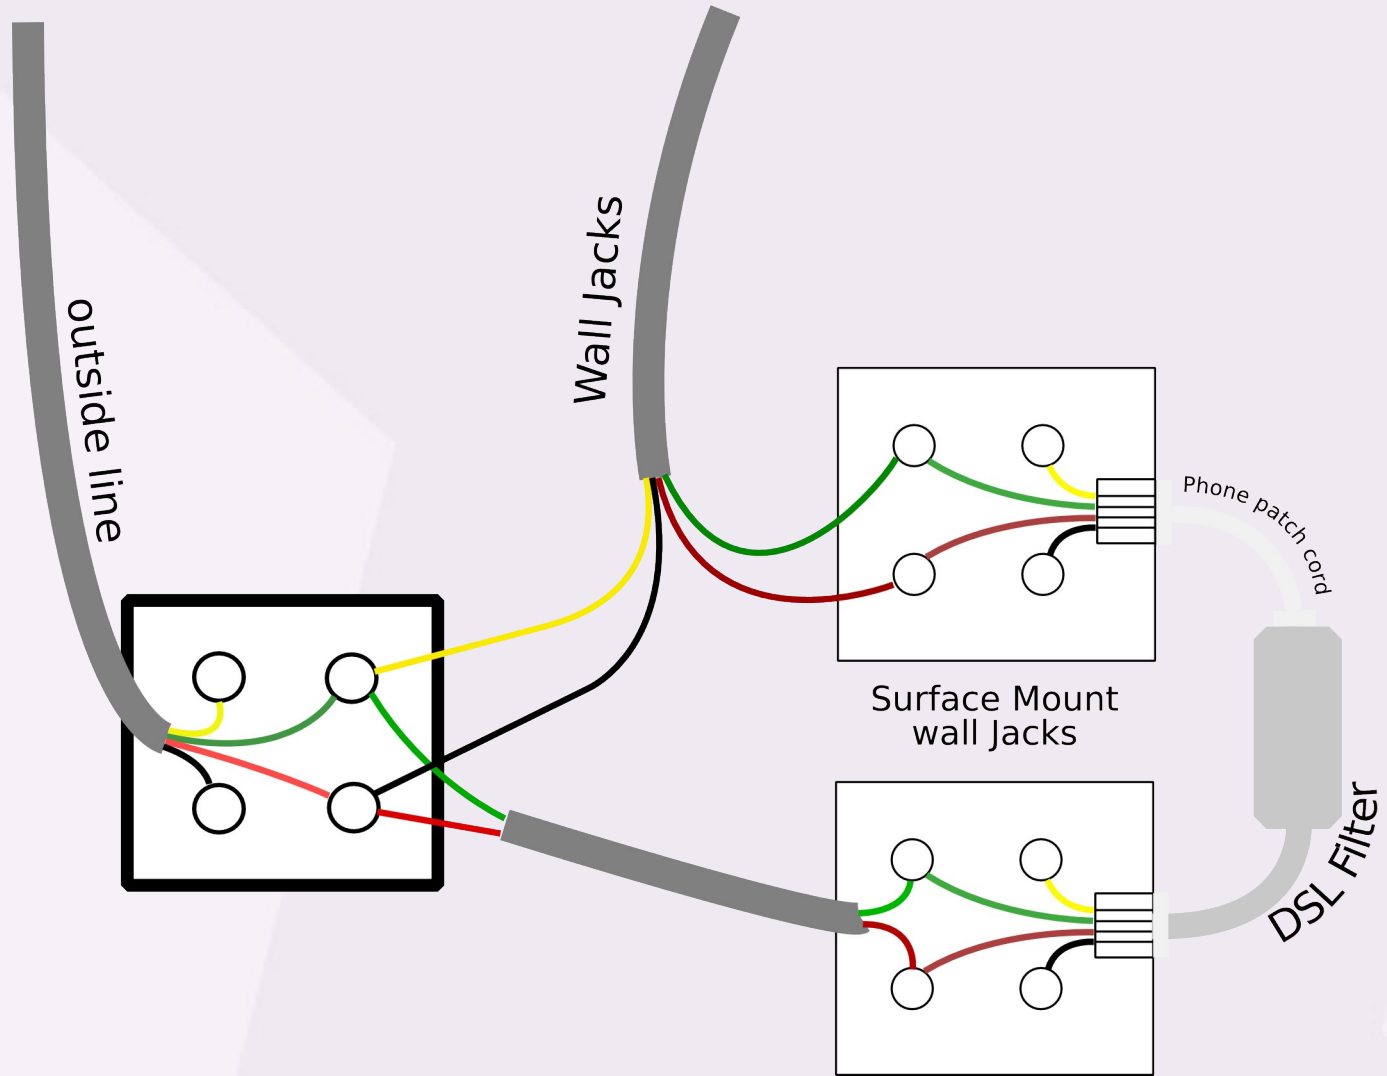

- Devote a pair of wires to the DSL modem
  - Locate it at the demarc (inside)
  - Dedicate a single bus to it
  - e.g. a jack at the demarc for the modem
  - not the best idea, unless there's only one jack on the pair
- Use the second pair to run DSL
  - Alter one jack for DSL (not recommended)
  - Double up a jack for the second line
  - Alter a phone cord/create converter

# Dedicated pair of wires

# Use Second Pair

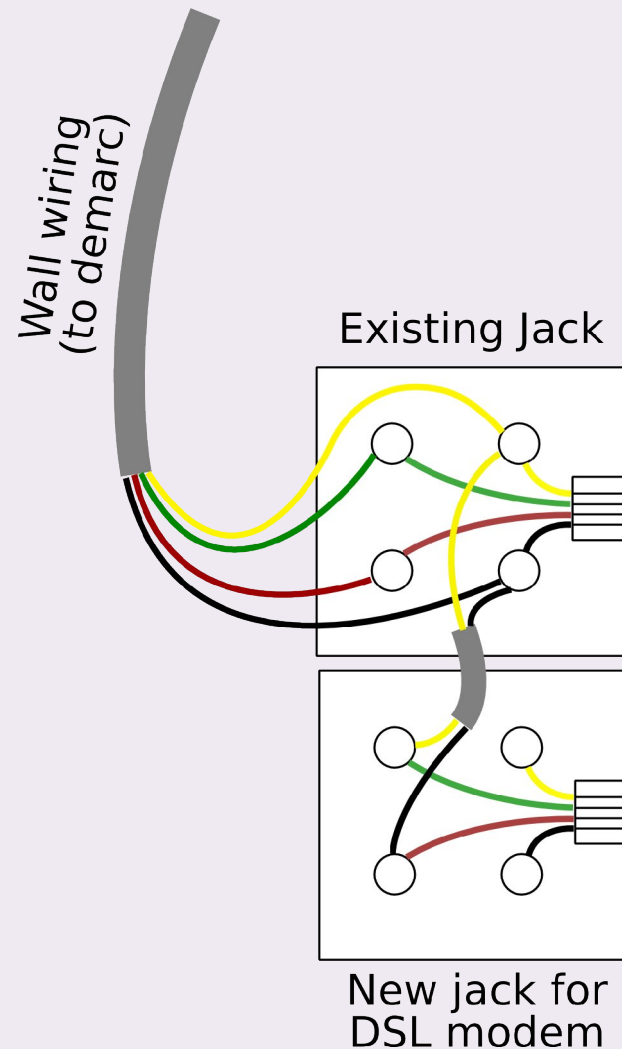

# Connecting DSL to the second pair

- If using the 2<sup>nd</sup> pair for DSL you need to connect to the modem to the 2<sup>nd</sup> pair by:
  - Altering the wall jack where the DSL modem is
    - Swap green/red with yellow/black (bad idea)
  - Adding another wall jack in the same location
    - X connect the yellow/black with the green/red on the new jack (better idea)
  - Creating an adapter cable
    - Swap green/red with yellow/black on the cable (requires crimpers, good idea)
    - Use a wall mount jack to create an adapter using a spare phone cord. (good idea)

# Adding a jack for 2<sup>nd</sup> pair

- Jumper the yellow/black from one wall jack to the green/red of the new jack.
- Mark the second jack as “line two”
- Look for dual-jack wall mount boxes and flush mount plates

# Handy Tools

- Punch tools
  - Red is 66/100 punch
  - 66 blade works with
- Beige is Bix punch
- Available at Home Depot
- \$30 to \$70
- An old credit card works too

# Crimp Tool

- Used for crimping phone wires.
- Make custom lengths
- Swap Green/Red with Yellow/Black
- Available at Home Depot \$50

# Butt Set

- Essentially a phone, but with alligator clips
- Available at Home Depot

# Tone generator

- Tone generator and inductive amplifier
- Attach the tone generator to a pair
- Use the inductive amplifier to locate the other end of the pair.
